

How to use Avast Software Updater

Only for PC not in a Domain

Open Avast by clicking on the Avast icon on the lower right side on the monitor.

Click on Scan → then click “Scan for outdated software”.

If any **“authorized”** software says it isn’t current, update the software by clicking the Update button. The available updates are then downloaded and installed.

You may see a popup to make this updating automatic. Just ignore this automatic update option.

If you have **“unauthorized”** software listed for updates you can click “Ignore updates” next to the software name. This will place the software in the “ignored software” category.

Authorized Software:

- Adobe Reader
- Flash player Active X
- Google Chrome
- Internet Explorer
- Java Runtime
